Use Case Diagram

→ A use case describes the functionality of a system that provides a meaningful result to an actor.

→ In simple terms, use case is something a user wants to accomplish using the system.

→ A use case diagram provides a high level view of –

① actors: who interact with the system.
② use cases: what they want to accomplish.
③ Relationships: how actors & use cases are connected.
④ System boundary: what belongs to the system.

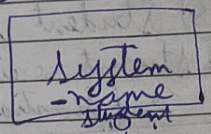

Note: It does not describe the detailed sequence of activities.

* 5 Questions

Q1) What is the system? → system boundary

Q2) Who uses the system? → actors

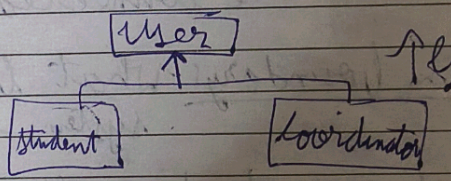

Q3) What does each actor want to accomplish? → use cases

Q4) Who performs which use case? → relationship

Q5) Is some behaviour mandatory or optional?

<< include >>
<< extend >>

↑ Generalization
↓ Specialization

Note: Don't confuse use cases with activities.

For eg: Student clicks login button, enters password, clicks submit, view dashboard, etc.

"login" as a use case & student is interacting with that use case.

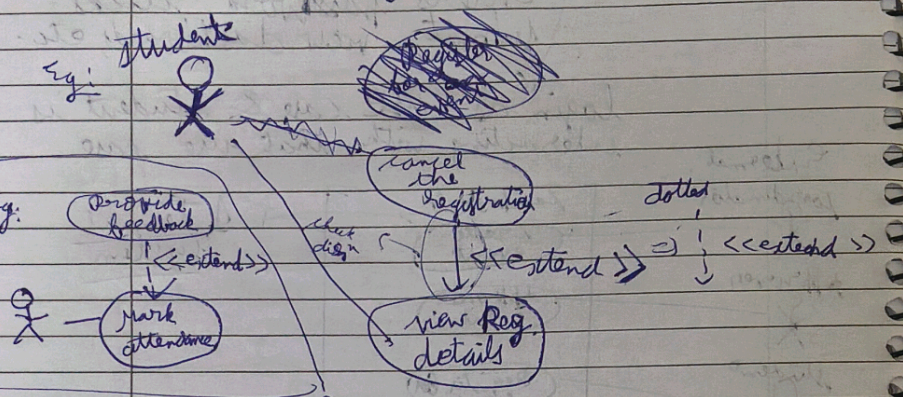

→ <<include>>: * suppose every registration requires the system to validate eligibility & check validity..

Note: * include means arrow points to what is included, i.e. it points to included use case.
* extend means arrow to what is extended, i.e. it points to the base use case.

→ <<extend>>: * suppose that the student may cancel registration.

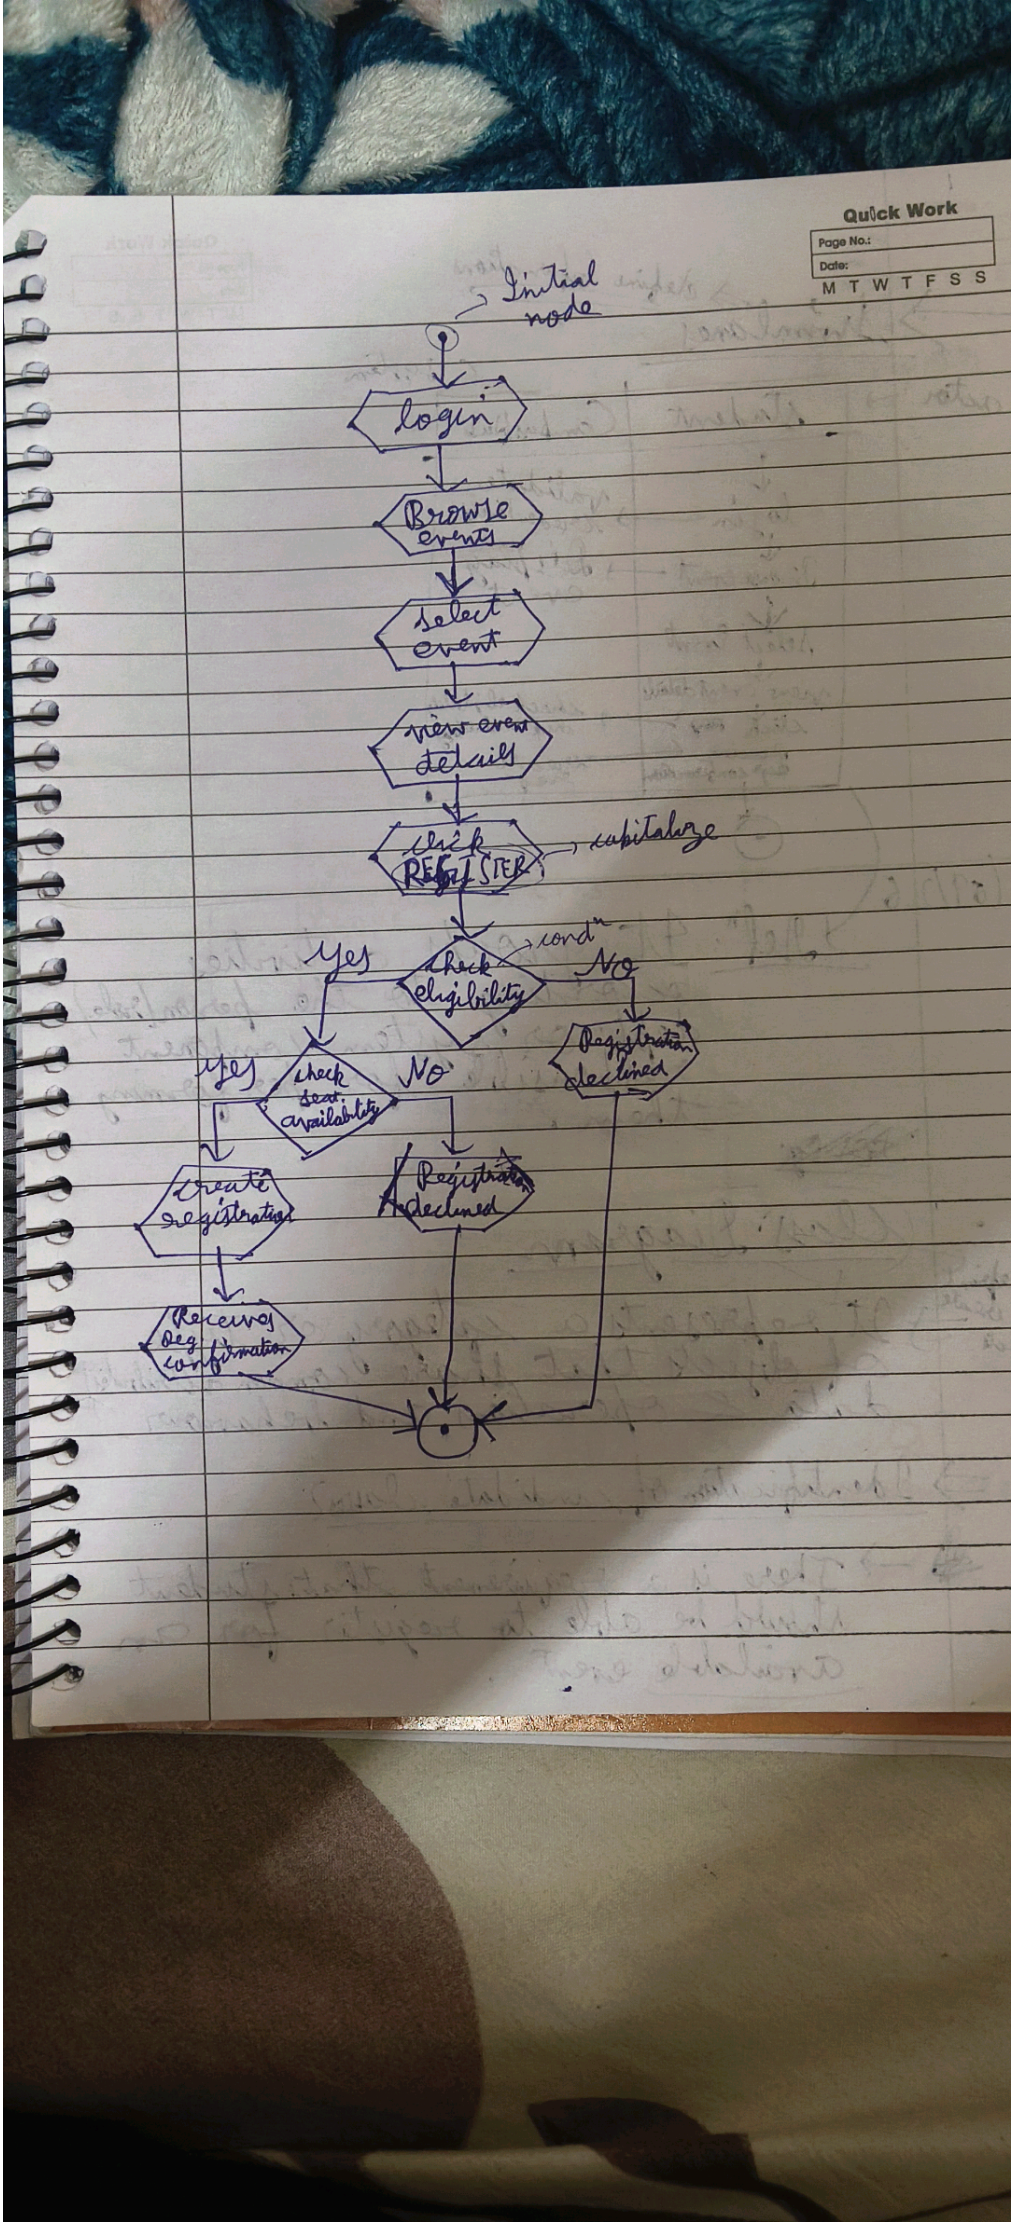

- Activity Diagram

* It represents the workflow of activities or actions in a system or business process.

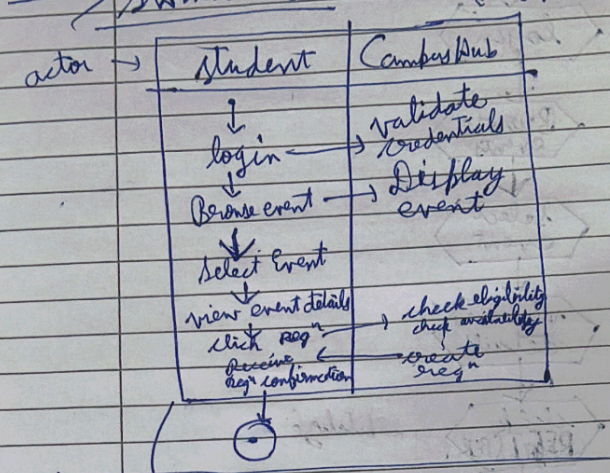

* In simple terms, it shows what happens in what order & what happens when a cond^n is True or False.

* Use case diagram tells us what a system does, while activity diagram tells us how a particular process flows from start to finish.

→ Swimlanes → define bifurcations

09/09/26

Def": It groups activities according to the person(role) dept. or system component responsible for performing them.

~~Todays~~

Class Diagram

blueprint to create objects.

→ It represents a category or type of objects that share common attributes/ data & operations and behaviour.

⇒ Identification of candidate classes:

→ There is a requirement that: student should be able to register for an available event.

Quick Work

Page No.:
Date:
M T W T F S S

Note: Register is an ~~event~~ action & registration is a thing or information entity.

not needed, only bare minimum

Student

- ~~SID~~ ~~branch~~
- Roll no
- Name
- Email

- login()
- RegisteforEvent()

Event

- EventID Capacity
- Name/Title status
- Venue
- Date

- CreateEvent()
- Edit Status()
- Event Publish()

Registration

- RegID
- Regdate
- Status

- ConfirmRegistration()
- CancelRegistration()

* class has information / data
  → It has its own ~~identification~~ identity.
  → It has behaviour.
  → It has relationships with other concepts.

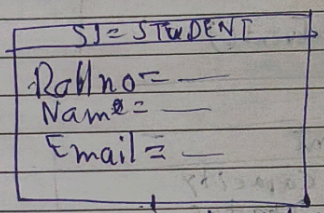

Objects represented using a rectangle.

Object diagram

An object is a specific instance of a class.

⇒ class diagram shows the generic structure, while object diagram shows a specific situation.

RegisteredBy()

ForEvent()
